

ABSTRACT OF THE DISCLOSURE

A projectile shooting toy comprises a body housing, a projectile delivery tube formed with an interior of the housing and a motor driven projectile firing apparatus having a trigger and projectile cannon pivotally mounted to the body housing. Activation of the trigger
5 causes the cannon to move from a stored position to a deployed position, allowing a projectile to enter an inlet of the projectile cannon from the projectile delivery tube. Activation of the trigger further causes a firing ram to abruptly strike the projectile and fire it from the cannon. In a preferred embodiment, the projectile shooting toy is in the form of a helicopter.
